Raphael Maris Ugboko, Human-Centered Computing, rugboko@g.clemson.edu
Clemson University

1. Executive Summary

The project consisted of 4 stages, each building on the previous sections. Part one of the project was the starting point. In that section, the group developed a mission statement containing the problem statements, goals to strive for, and established the main customers using the final product. The first action the group completed was to establish a problem statement. The main issue the group needed to solve was that our customer, a Clemson-based IT company, lacked a centralized ticket management dashboard. After identifying the main problem and the main customers, the priority was understanding the customers' needs. The group determined 8 primary and 18 secondary needs through semi-structured interviews and surveys. The project's second phase consisted of creating measurable limits for the new system. The group identified the market specifications our system needed to match or exceed. After establishing the specifications, we determined the categories of customers and began generating ideas for our final design. The group determined the final design after generating 8 concepts based on the primary needs and selecting the best combination of parts. With this final design, the group reached out to the customers to determine how well we matched their expectations and to run tests to determine how well they could use the new design. In that testing period, the group determined which changes to make to the final design and which elements the users found helpful or unhelpful. The final concept included a simple-looking homepage that included the tickets that are currently being worked on, as well as a version of the webpage that only managers have access to that showed the analytics as well as schedules of their employees.

2. Introduction

PD 4 combines everything we have done so far, focusing on turning our ideas into a fully functional product. In Projects 1 through 3, we identified the need for a better IT ticketing system, set clear goals for what the system should achieve, and looked at different design options. In Project 4, the task is to build working prototypes, test them with actual users, and improve the design based on their feedback. The detailed design process will involve adjusting and ensuring the final product meets customer needs and technical standards. The report will cover testing, final design, and the implementation plan to deliver a product that effectively solves the identified problem.

PD1 - Identifying Customer and User Needs

The PD1 report focused on understanding the challenges faced by CECAS CORE's IT ticketing system. Through user interviews and surveys, the team identified key issues, such as inefficiencies in ticket assignment, slow response times, and a lack of streamlined workflows. Manual processes and misrouted tickets hindered the system's usability. The goal was to address these pain points by designing a more intuitive and efficient dashboard. The insights gathered formed the foundation for defining the system's requirements and set the stage for the next phase of development, where specific measurable specifications would be established to guide the design.

PD2 - Establishing Target Specifications

The PD2 aimed to convert the identified user needs from PD1 into precise, quantifiable design specifications. By benchmarking existing IT ticketing solutions like Zendesk, ServiceNow, and Jira, the team developed a set of performance metrics, such as user satisfaction scores, task completion time, and the accuracy of ticket searches. These metrics, paired with the prioritized user needs, provided a roadmap for the design of the IT dashboard. The project balanced the need

for a high-performance, user-friendly interface with the practical considerations of feasibility and cost, ensuring the dashboard would meet functional and operational requirements.

PD3- Concept Generation and Evaluation

The PD3 shifted from user needs and specifications to creating and evaluating potential design solutions. Using Ulrich and Eppinger's concept generation methodology, the team developed wireframe concepts incorporating intuitive navigation, task prioritization, role-based customization, and real-time collaboration. These concepts were evaluated through screening matrices, where the team selected a hybrid design that combined the best features of each idea. The chosen concept emphasized key functions such as urgent ticket visibility, efficient search and filtering, and the ability to customize user roles, setting the stage for prototyping and further refinement in the next phase.

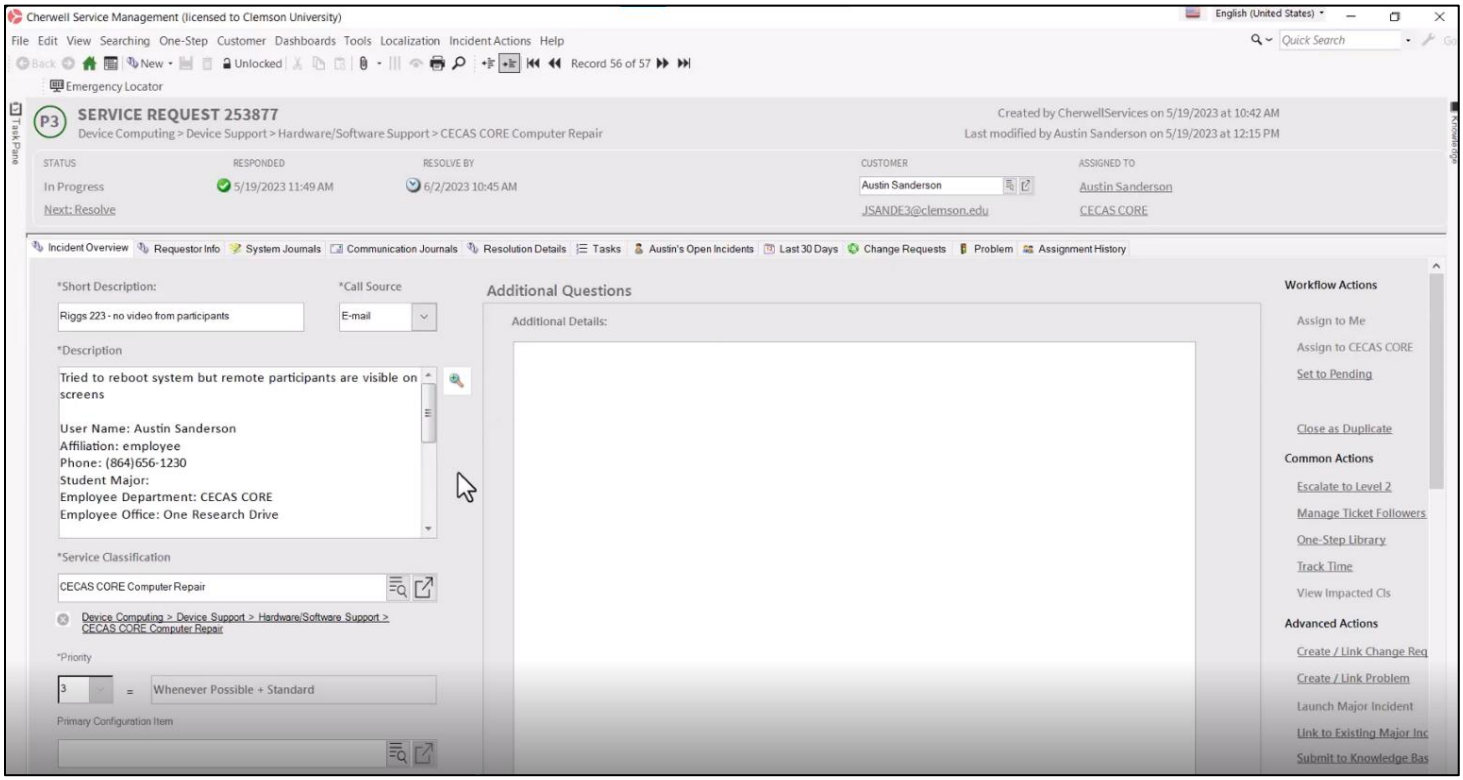

3. **Current State of the System**

Clients have shared both positive and negative feedback about the current system. The system is primarily used to handle daily tasks and manage support tickets from clients. When a ticket is submitted, clients automatically receive email updates when the ticket is assigned and resolved. These emails also facilitate communication, allowing the client to stay in touch with the person handling their issue. The dashboard enables users to assign tickets to themselves and filter them based on the person to whom they are assigned. While these features provide basic organization, the system's functionality is limited when addressing more complex workflow needs. However, after speaking with users, several significant issues have emerged. The most prominent issue is that much of the process remains manual. For instance, assigning tickets, explaining why a ticket was closed, and updating ticket statuses are all manual tasks. As a result, tickets are often misdirected to the wrong team, which leads to delays and confusion. The support team must then

spend additional time rerouting tickets to the correct person, transforming a streamlined process into an inefficient workflow. Many users have described the system as “clunky” and difficult to navigate, reporting frustration with its unintuitive interface. The main frustrations identified include slower response times, misassigned tickets, and difficulty navigating the dashboard.

Figure 1: Current interface of IT Ticketing system

Additionally, the system does not notify users when tickets have remained unresolved for an

extended period without updates or responses. This lack of timely reminders creates a situation where unresolved tickets may be overlooked, further contributing to delays in response time and issue resolution. Without automatic escalation or alerts for inactive tickets, the system fails to prioritize the most critical tasks, ultimately affecting customer satisfaction.

The poor usability and excessive reliance on manual work hinder productivity and make it increasingly challenging to respond to clients promptly and accurately. These inefficiencies reduce

the ability of the support team to effectively manage and resolve tickets, which is essential for meeting client needs promptly. The lack of automation and the need for continuous manual oversight increases the risk of errors and missed opportunities to improve service. As a result, the support team spends valuable time on administrative tasks instead of resolving client issues and delivering high-quality service.

4. **Mission Statement**

The mission of this project is to develop an Integrative Dashboard for IT Ticketing System that enhances the management of IT support workflows across Clemson University's CECAS CORE, ensuring a seamless experience for IT staff and users alike. This centralized system aims to provide efficient ticket retrieval, improve user satisfaction, and offer an intuitive, easily navigable interface. The new dashboard will optimize workflows by addressing key pain points in the existing system, such as manual processes and misassigned tickets, reducing response times and streamlining ticket resolution. The goal is to improve user satisfaction with the new dashboard by 40%, ensuring users can access and resolve tickets quickly while maintaining high usability and efficiency standards.

The primary market for the dashboard will be Clemson University CECAS CORE, with potential secondary markets including the broader Clemson University IT department, other university IT departments, and software development companies. The dashboard will be easily integrated into the existing system, ensuring compatibility with current software and offering a simple learning curve for new users. This will allow IT staff, directors, and managers to seamlessly transition to the new system without significantly disrupting workflows. The new dashboard will also enable customization and integration with existing IT infrastructure. The dashboard’s key business goals include successful integration by May 1st, 2025, and providing a user-friendly interface that

addresses specific customer needs, such as a clear view of performance metrics, task prioritization, and real-time collaboration. Through this product, we aim to foster enhanced communication, consistent user experience, and accessible functionality for all stakeholders involved.

5. **Customer Needs Analysis**

To accurately define the IT Ticketing Dashboard's needs, we interviewed key stakeholders, including IT help desk staff, managers, and directors. These interviews provided valuable insights into the new system's current pain points and expectations. The primary concerns revolved around inefficient ticket management, slow response times, and lack of visibility over ticket statuses, contributing to decreased productivity and user frustration. Stakeholders highlighted the need for a centralized system to provide a more intuitive, streamlined ticket assignment and resolution process, allowing IT staff to handle issues more effectively.

We identified primary needs such as the requirement for a user-friendly interface that minimizes manual intervention and the need for real-time ticket tracking to enhance visibility and speed up response times. Additionally, stakeholders emphasized the importance of personalized dashboards for different roles (staff, managers, directors) to quickly identify urgent issues, monitor performance metrics, and track ticket resolutions. Secondary needs included features like role-based filtering of tickets, automatic notifications for stalled tickets, and the ability to customize views according to individual user preferences. To ensure a robust understanding of these needs, we prioritized them through a vital survey using a 5-point Likert scale. Needs above 3 were classified as high priority, guiding the development of our system’s key features. By aligning these needs with technical specifications, we ensured that the IT ticketing system would meet the specific demands of the users while providing an efficient and scalable solution.

6. **Target Specifications**

The target specifications for the IT Ticketing Dashboard were crafted to address the specific needs identified during the Customer Needs Analysis phase. These specifications are quantifiable performance indicators designed to ensure the dashboard fulfills its core objectives, such as enhancing user efficiency, streamlining task management, and improving user satisfaction. The development of these specifications was informed by extensive stakeholder feedback, including interviews and surveys, and by reviewing best practices from current IT ticketing systems, guaranteeing that the dashboard aligns with user needs and adheres to industry benchmarks for performance and usability.

7. Persona

The IT Ticketing Dashboard significantly improves the workflow for each persona by addressing specific pain points. As an IT support staff member, Marcela struggled with a cluttered interface that made prioritizing and managing tickets efficiently challenging. The new dashboard offers a clean, intuitive layout with automatic ticket prioritization, enabling her to access urgent tickets and complete tasks faster easily. The old system lacked visibility in team performance for Alex, the IT Manager, requiring him to track tickets manually. The new system provides real-time performance metrics, allowing Alex to monitor the team's progress and intervene when necessary, improving both productivity and task distribution.

Evan, another IT support staff member, faced challenges in quickly identifying which tickets required his immediate attention, leading to delays. The new dashboard prioritizes and highlights unresolved tickets by urgency, streamlining its workflow and reducing time spent searching for tickets. The IT Director, Derek, previously struggled to manage multiple teams without a high-level overview of ticket statuses and performance. With the new system, Derek can now view all

tickets in real time, track performance, and identify bottlenecks, making it easier to ensure timely ticket resolution and improve team efficiency.

8. Concept Generation

The concept generation phase for the IT Ticketing Dashboard involved extensive brainstorming to explore a variety of potential solutions for the challenges identified in the user needs analysis. The team focused on creating design concepts that would address the key pain points such as inefficient ticket prioritization, slow response times, and complex navigation. Several ideas were proposed, including role-based dashboards that would tailor the interface for different user types, such as IT staff, managers, and directors. Additionally, concepts like customizable ticket views and a clean, intuitive interface were discussed to help users quickly prioritize and resolve tickets. Another important feature was real-time performance tracking, enabling managers to monitor team performance and identify bottlenecks instantly. The team also considered integrating advanced search and filtering options to help users find specific tickets faster. Once the initial concepts were sketched out, they were shared with stakeholders for feedback, which helped refine the ideas and ensure they aligned with user expectations and technical requirements.

9. Concept Selection

The team applied a structured evaluation methodology for concept selection, using a screening matrix to assess each design concept against specific criteria such as user needs, feasibility, and alignment with project goals. Each idea was rated based on how well it addressed the prioritized needs, such as reducing time spent on administrative tasks, improving the accuracy of ticket assignment, and enhancing the system's overall usability. After reviewing the concepts, the team identified that a role-based navigation system was essential for providing tailored views

for different user types, which would improve the dashboard's efficiency. Additionally, priority ticket highlighting emerged as a key feature to ensure that urgent issues were clearly visible, while real-time performance tracking was identified as crucial for helping managers oversee team productivity. The strongest features from each concept were then combined into a composite design that balanced practicality with user-centric functionality. This final design was selected for its ability to meet the system's core objectives while remaining feasible within the project's time and resource constraints. The selection process ensured that the design would address immediate user needs and long-term scalability.

10. Examples of Norman's design principles

Application of Don Norman's Concepts in Dashboard Interface Design: In developing the centralized IT ticketing dashboard for Clemson campuses, Don Norman's core user-centered design principles were explicitly applied to optimize usability, efficiency, and user satisfaction. The following section elaborates on how each principle was implemented:

1. Making Things Visible

Visual indicators were embedded into the dashboard to reduce cognitive load and improve task prioritization. Each task or ticket has a color-coded priority circle and a clear textual label (e.g., "CRITICAL" with a prominent red dot). This ensures that users can quickly perceive the urgency of different tasks without needing to delve into detailed ticket descriptions. Visibility of system state is a fundamental requirement for intuitive interface behavior and supports Norman's principle that users should always be able to answer, "What is happening?"

2. Providing Affordances

Interactive modules such as "Campus Performance Metrics" and "Team Management" were designed with raised, button-like shapes featuring gear icons. These shapes naturally afford interaction, signaling to users that these elements are clickable for additional settings or actions.

The system minimizes ambiguity regarding available operations by visually representing actionable features and enhances overall discoverability.

3. Using Natural Mappings

Familiar symbols ensured intuitive mappings between interface elements and their functions. For example, a human figure icon is used for accessibility settings, while a bell icon is utilized for system alerts. These common digital metaphors leverage users' prior experiences, facilitating faster learning and reducing the need for training. Effective natural mappings allow users to predict outcomes based on the appearance and placement of controls.

4. Making Use of Constraints

The navigation was intentionally constrained to four main categories: Dashboard, Tickets, Settings, and Reports. This limitation prevents users from navigating into unsupported or unintended areas, maintaining focus on the core tasks. By applying logical constraints, the design minimizes error opportunities, supports task completion, and promotes a streamlined user experience.

5. Providing Feedback

The system provides both visual (e.g., status indicators) and numerical feedback to confirm user actions such as ticket updates or assignments. This immediate and meaningful feedback reassures users that their inputs were received and processed correctly. Feedback is essential in closing the action-perception loop, reducing uncertainty, and promoting confidence in system use.

11. Results and subsequent iterative refinement of Usability Test

We conducted a usability test with our stakeholders, and overall, the session went well. The three main metrics we emphasized are: (1) Average Time taken to complete a standard navigation task (e.g., find a specific feature), (2) Average Time taken to access the status link (high priority, low priority), and (3) User Satisfaction Score for Intuitiveness. After allowing our stakeholders to navigate the system, the main feedback that was given was that the dashboard should prioritize displaying tickets. Stakeholders emphasized that unresolved and in-progress tickets should be the primary focus of the home screen; everything else comes second. Despite this change request, stakeholders responded positively to several design elements in the prototype. Some features were highlighted as improvements they would like to see implemented in their current system—specifically, the inclusion of AI assistance, which they advised us to retain in future iterations. Based on this feedback, the key change we will implement is updating the home screen to immediately display tickets that require attention. We will also preserve design elements that stakeholders specifically appreciated. To evaluate the usability of the system, we employed the System Usability Scale (SUS)

Participant's Responses and Scoring:

Item	Statement (Summary)	Response	Adjusted Score
1	System was unnecessarily complex	1	4
2	System was easy to use	4	3
3	Needed technical support	5	0
4	Functions well integrated	3	2
5	System had too much inconsistency	4	1
6	Most people would learn the system quickly	4	3
7	Felt confident using the system	5	4
8	System was very cumbersome	1	4
9	Needed to learn a lot before getting started	1	4
10	Would like to use the system frequently	4	3

Total Raw Score = 28

SUS Score = 28 × 2.5 = 70

The resulting SUS score of 70 indicates that the system’s usability is above average, as the benchmark average SUS score across various systems is approximately 68. This suggests that users generally found the system usable, though there may still be opportunities to simplify certain aspects or reduce the perceived learning curve.

12. Next Steps Required to implement the system.

The next steps required to implement the system are as follows:

System Integration: Integrate backend components and test system functionality across all campuses.

Training: Conduct stakeholder-specific training sessions with user guides and videos.

Monitoring: Track key performance metrics like response time and user satisfaction.

Refinement: Use user feedback to enhance filters, accessibility, and workflows iteratively.

Deployment: Roll out the system in Initial, partial, and full phases with dedicated support.

13. Summary and Conclusion

The PD4 phase focused on developing detailed prototypes and conducting user testing to validate the proposed IT ticketing dashboard. Feedback from real users helped refine the design, ensuring it effectively addresses the key pain points identified in earlier phases such as misassigned tickets, lack of notifications, and manual processing. These improvements directly support CECAS CORE's goals of increasing efficiency, improving client satisfaction, and streamlining internal workflows. The iterative testing process confirmed that the dashboard enhances usability, reduces response times, and better supports day-to-day operations for the IT team. With user insights now fully integrated into the solution, the project is well-positioned for final implementation. The success of PD4 highlights the value of human-centered design and iterative development in creating tools that not only meet technical requirements but also genuinely improve organizational effectiveness. Looking ahead, future work could explore integrating AI to suggest ticket routing, implementing mobile responsiveness for support staff in the field, and incorporating more detailed analytics dashboards to track performance and bottlenecks in real-time.

Appendices

Appendix A: Mission Statement

Mission Statement: Integrative Dashboard for IT Ticketing System	
Product Description	• A centralized system that enhances the management of IT Ticketing workflows across three campuses
Benefit Proposition	• Efficient ticket retrieval system • Centralized ticket management
Key Business Goals	• Improve User satisfaction with the new dashboard by 40%. • Integrate new dashboard by May 1st, 2025
Primary Market	• Clemson University CECAS CORE
Secondary Market	• Broad Clemson University IT department • Other University IT departments • Software development companies
Assumptions and Constraints	• Easily integrated into existing system • Compatible with current software • Simple to learn
Stakeholders	• IT Help Desk Staff • Directors • Managers

Appendix B: List of Users identified needs

No		Need	Imp *
1	The System	is intuitive and navigable.	4.8
2	The System	highlights important content.	3.3
3	The System	prioritizes relevant information.	4.3
4	The System	tracks performance metrics.	4
5	The System	returns relevant searches.	3.7
6	The System	enhances ticket searches.	2.8
7	The System	offers personalized dashboards.	3.2
8	The System	organizes priority tasks.	3.8
9	The System	provides status links.	3.5
10	The System	allows team collaboration.	3.2
11	The System	supports role-based functionality.	3.5
12	The System	allows progress documentation	3.1
13	The System	provides customer feedback.	3.8
14	The System	The system supports customization and integration	3.6
15	The System	The system provides ticket filtering.	4.1
16	The System	The system is easy and navigable.	4.8
17	The System	The system facilitates email communication.	3
18	The System	The system allows team collaboration.	3.7

Importance rated on scale of 1-5, 5 being most important

Appendix C: Target Specifications

Metric No.	Need Nos.	Metric	Imp	Units	Marginal Value	Ideal Value
1	1, 16	User satisfaction score for intuitiveness rated by 6 users using a SUS scale where 1= the least intuitive and 5= most intuitive	4.8	Score	>=3	5
2	1,16	User satisfaction score for navigability rated by 6 users using a SUS scale where 1= the least navigable and 5=most navigable		score	>=3	5
3	1, 16	Average Time taken by 6 users to complete a standard navigation task (e.g., find a specific feature)	4.8	Seconds	<25	<15
4	2, 15	Percentage of users (out of 6) who locate urgent tickets within 15 seconds.	3.3	% of users	>=70	>= 90
5	3	Relevance score rated by 6 users using the SUS scale (1=relevant, 5=highly relevant) for prioritized information (e.g., ticket urgency labels).	4.3	Score	>=3	= 5
6	4	Percentage of users who successfully generated a performance report containing all 5 predefined metrics (e.g., resolution time, backlog size).	4	Percentage	>=70	= 100
7	4	The average time taken by 6 users to generate a standard performance report.	4	Seconds	<25	<15
8	5	The number of search results rated relevant by 6 users (e.g., 10 sample searches per user).	3.7	Score	>=5	=10
9	6	Average time for 6 users to locate a specific ticket via search (e.g., using keywords like "server outage").	2.8	Seconds	<20	<10

10	8	Number of tasks prioritized correctly by 6 users (e.g., 10 sample tickets).	3.8	Count	>=5	= 10
11	9	Percentage of users who could access the status link within 20 seconds among 6 users.	3.5	%	>=70	= 100
12	9	Percentage of users who find status links useful rated on a scale of 1-5 on SUS usability scale among 6 users	3.5	% of users	>=70	>=90
13	10, 18	Number of collaboration actions (e.g., shared notes, mentions) used by 6 users within 30 seconds of ticket identification.	3.2	Count	>=2	=5
14	11	User satisfaction score for role-based functionality rated on a scale of 1-5 SUS usability scale for 6 users	3.5	Score	>=3	=5
15	11	Number of users (out of 6) who complete role-specific tasks error-free within 2 minutes.	3.5	% of users	>=60	>= 95
16	12	Percentage of tasks with documented progress out of 10 by 6 users	3.1	% of tasks	>=50	>= 90
17	13	Average customer feedback score rated by 6 users on a scale of 1-5 SUS Usability scale (e.g., NPS or satisfaction rating)	3.8	Score	>=3	= 5
18	13	Percentage of feedback tickets resolved by 6 users in 1 hour.	3.6	%	>=70	= 100
19	14	The average time taken by 6 users to deploy customization (e.g., new ticket category).	3.6	Seconds	>=25	>= 15
20	15	Number of tickets filtered correctly (out of 20) by 6 users.	4.1	%	>=70	=95
21	15, 6	Filtering accuracy score (1–5) SUS Usability scale rated by 6 users where 1 =less accurate and 5= most accurate	4.1	% of users	>=3	=5

22	16	Number of users (out of 6) completing 5 core tasks without assistance within 45 seconds	4.8	%	>=70	=100
23		Average Time taken for 6 users to respond to urgent emails.	3	Seconds	<25	<10

Metric No.	Metric Description	Units	Revised Metrics for final concept
1.	User satisfaction score for intuitiveness (1 = least intuitive, 5 = most intuitive)	Score	4
11.	Average time taken to access the status link (high priority, low priority)	Seconds	20 seconds
15.	Time taken to complete role-specific tasks error-free (Managers and Students)	Seconds	60 seconds (Manager), 105 seconds (Students)
20.	Number of tickets filtered correctly (out of 20)	%	Pre-configured, Net zero
22.	Time taken to complete five core tasks without assistance during active filtering	Seconds	10-15 seconds

Appendix D: Persona

Marcela Andrade

Student Employee,
IT Support Services

Demographics:	• Early 20s • Undergraduate student • Part-time at university IT office
Goals and Tasks:	• Manage support tickets • Reassign and track issues • Communicate with users
Environment:	Uses desktop in a university IT office. Prefers a clean, easy-to-navigate interface with clear organization.
Challenges:	• Hard to access user info quickly • Messaging system is clunky • Important UI elements are too small
Suggested Improvements:	• Highlight key tasks visually • Simplify communication steps • Make UI more readable and consistent
Quote:	"It should be very similar to what we have now, just clearer and easier to read."

Alex Thompson

Director of IT Management,
IT Support Services

Demographics:

- Role: Director of IT Management
- Team Size: 10 full -time staff, 5 student employees
- Campus Reach: Three campuses

Goals and Tasks:

- Organize and track IT requests efficiently.
- Enhance communication with students and faculty.
- Analyze ticket data to identify support needs.

Environment:

Uses a desktop and mobile devices in a university IT office. Relies on current ticketing system and email for communication.

Challenges:

- Limited system integration affects efficiency.
- Difficulty identifying unassigned tickets.
- Ineffective triaging slows service delivery.

Suggested Improvements:

- Enhance triaging support for better prioritization.
- Improve ticket visibility to prevent oversight.
- Enable integrations with other systems to streamline workflows.

Quote:

"I want a system that simplifies request management and enhances communication, allowing us to provide better service."

Evan Stanford

Student Employee,
IT Support Services

Demographics:

- Early 20s
- Undergraduate student
- Familiar with only basic technical systems

Goals and Tasks:

- Respond to customer tickets
- Create and manage meetings based on customer requests
- Set up, update, and resolve issues from tickets

Environment:

Uses CherWell to manage tickets from customers. Works alongside employees who may have different technical skill levels

Challenges:

- Some tasks can be hard to execute without prior experience.
- The interface can be confusing for users who are not technologically inclined

Suggested Improvements:

- Redesign the interface to be more user -friendly.
- Simplify the overall layout for new users.
- Improve onboarding or guidance for tasks .

Quote:

"It can be a little overwhelming if you're first getting used to it just because of how many words there are and sometimes you can't it's hard to find where things are."

Derek Miller

Manager and Lead IT Coordinator.

Demographics:

- Mid-30s to 40s
- Full-time staff
- IT Manager for College of Engineering, Clemson University

Goals and Tasks:

- Oversee IT support workflows
- Design and maintain custom dashboards
- Ensure efficient ticket resolution and team productivity

Environment:

Uses a desktop in his university IT office. Prefers efficient, transparent systems with clear task visibility and strong team integration.

Challenges:

- Back-end ticket system is clunky
- Difficult to triage and prioritize tickets
- Limited system integration and API access

Suggested Improvements:

- Improve visibility with organized ticket “buckets”
- Streamline interface for faster onboarding

Quote:

“We are building the dashboard because the original system just wasn’t functional for our needs.”
